

Fixed or Floating: Which is Best?

Prof. Lutz Hendricks

Fixed or Floating?

The model makes fixed exchange rates look very attractive

- ▶ avoid volatile exchange rates
- ▶ gain the exchange rate as a policy tool

Main drawback

- ▶ loss of monetary policy tools
- ▶ but that can also be a benefit ...

Then why are there so few fixed exchange rate regimes left?

Exchange rate volatility

Even for major currencies, exchange rates fluctuate a lot.

Source: FRED

Inflation volatility

But there is a trade-off: inflation is volatile with fixed exchange rates.

Intuition?

Currency Crises

Currency Crises

Nearly all fixed exchange rate regimes have collapsed

- ▶ traders sell a currency, hoping for a devaluation
- ▶ “**speculative attacks**”

As capital flows got larger, CBs found it harder to defend against attacks.

This is the main reason why fixed exchange rate regimes are now rare.

- ▶ but “hard pegs” like the EU have become more common.

Crisis Examples

Crisis Examples

A typical (Latin American) story:

- ▶ a country pegs against the dollar
- ▶ large fiscal deficits are financed by printing money
- ▶ high inflation causes real appreciation and trade deficits
- ▶ the central bank raises interest rates to prevent capital flight
- ▶ crash

Crisis Examples

Speculative attacks even hit the Euro zone.

Currency Crises

Why are speculative attacks so common?

The short answer:

- ▶ The peg provides **insurance** for speculators who bet against a currency.

With floating:

- ▶ The exchange rate could move up or down in the future.

With the peg:

- ▶ The currency can only go **down**.
- ▶ Then short sellers make large profits.

Short selling is low risk.

The Logic of Speculative Attacks

UIP:

$$i_t = i_t^* + x_t \quad (1)$$

$$x_t = \frac{E_{t+1}^e - E_t}{E_t} \quad (2)$$

x : expected FX appreciation appreciation.

Floating: x_t can be positive or negative.

- ▶ Selling a currency has upside risk and downside risk.

Peg: the CB ensures that the currency does not appreciate

- ▶ x_t can never be negative.
- ▶ Selling a currency only has upside risk.

Currency Crises

Even small chances of devaluation have big effects.

Example:

- ▶ 25% chance of 20% devaluation over the next month
- ▶ $x_t = 0.75 \times 0 + 0.25 \times -0.2 = -0.05$
- ▶ investors demand an interest premium of **5% per month** to compensate for this risk

Policy Options

1. Raise i by 60%
major recession as borrowing shuts down
2. Raise i by less than 60%
 - ▶ capital outflows
 - ▶ CB must sell FX to stabilize currency
 - ▶ CB eventually runs out of reserves
3. Devalue the currency

Lessons

1. Fixed exchange rates are fragile
 - 1.1 they can only be sustained as long as investors remain utterly convinced that a peg will hold
 - 1.2 betting against a peg is insured by the government
2. Fixed exchange rates can collapse without reason
If many investors believe the peg will fail, it will fail.

Currency Unions

One solution: get rid of the exchange rate entirely

- ▶ Main example: Euro
- ▶ Speculative attacks are no longer possible.

Costs:

- ▶ hard to reverse (Brexit)
- ▶ EU monetary policy may not suit all countries

Recap Questions

1. Why might a country with a weak central bank choose a peg?
2. Why are interest rates volatile under fixed exchange rates?
3. Why is inflation volatile under fixed exchange rates?
